### 1. Biological Information

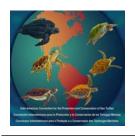

### 1.1. Species present

Species	Pacific Ocean	Atlantic Ocean	Caribbean Sea	
Species	Phase(s)	Phase(s)	Phase(s)	
Lepidochelys olivacea	F, M			
Lepidochelys kempii		F, M		
Dermochelys coriacea	F, M	R, F, M,	R, F, M	
Eretmochelys imbricata		R, F	R, F, M	
Chelonia mydas	F, M	R, F, M	R, F, M	
Caretta caretta		R, F, M	F, M	

Phases: R = Reproduction; F = Foraging; M = Migration; D = Phase Unknown

### 1.2. Important sites for sea turtle conservation

	Name of Site	Species (s)	Season	Geographic Location (Lat/Long)	Area (km or hectares, if applicable)	Protection Category	Observations
Nesting Site	Texas	Lk, Cm, Cc	April- October		373 km	Public & private	Lk=102, Cm=2, Cc=2 *
	Alabama	Cc, Lk	May- October		75 km	Public & private	Cc=45, Lk=1 *
	Florida	Cc, Cm, Dc, Ei, Lk	March- October		1,295 km	Public & private	Cc=49,775, Cm=4,969, Dc=540, Ei=5, Lk=5 *
	Georgia	Cc, Cm, Dc	May- October		161 km	Public & private	Cc=1,396, Cm=1, Dc=0, Lk=0 *
	South Carolina	Cc, Cm, Dc	May- October		303 km	Public & private	Cc=2,568 *
	North Carolina	Cc, Cm, Dc	May- October		531 km	Public & private	Cc=794, Cm=6, Dc=0 *
	Culebra Island, Puerto Rico	Dc, Ei	All year		4 km	Commonwealth Reserve	Dc=133, Ei=51
	Fajardo, Puerto Rico	Dc	March- August		22 km	Public & private	Dc=230
	Humacao, Puerto Rico	Dc, Ei	All year		15 km	Public & private	NA

	Mona Island.	Ei	All year	 7 km	Commonwealth	Ei=951, Cm=8 *
	Puerto Rico				Reserve	, , ,
	Buck Island	Ei	All year	 	NPS National	Ei=54, Cm=23, Dm=1 *
	Reef,				Monument	
	U.S. Virgin					
	Islands					
	Sandy Point,	Dc, Ei, Cm	All year	 3 km	USFWS Refuge	Dc=373, Ei=8, Cm=37 *

<sup>\*</sup> Number of nests laid in 2006 (numbers for Florida and Buck Island Reef are preliminary).

#### **NESTING SITES**

**Texas:** Although the primary nesting beach for the Kemp's ridley is at and near Rancho Nuevo, Tamaulipas, Mexico, nesting of the Kemp's ridley in the state of Texas has been increasing since the mid-1990s.

**Alabama:** Only one species of sea turtle, the loggerhead, regularly nests in Alabama, although occasional solitary Kemp's ridley nesting has occurred in Alabama in recent years. Although the level of nesting in this state is small, the loggerheads nesting here are believed to be part of the Florida panhandle (northern Gulf) nesting subpopulation.

Florida: Three species of sea turtles, the loggerhead, the green turtle, and the leatherback, regularly nest on Florida's beaches. Two other species, the hawksbill and Kemp's ridley, nest infrequently. The annual number of loggerhead nests counted at core index beaches in Florida ranged from 29,547 to 59,918 nests from 1989-2006. A recent analysis of trends in Florida's loggerhead sea turtle nesting (1989-2005) revealed a significant decline in nesting numbers around the state. The analysis indicates nest counts have declined 22.3% from 1989 to 2005. There has been a 39.5% decline since 1998. An average of 14,423 loggerheads nested on Florida beaches between 2001 and 2005. Major U.S. green turtle nesting occurs in Florida and has been steadily increasing since index nesting beach surveys began in 1989. Annual green turtle nesting at core index nesting beaches in Florida shows high biennial fluctuations in nest numbers. Between 1989 and 2006, the annual number of green turtle nests at core index beaches ranged from 267 to 7,158. Because green turtles commonly take a year off between migrations to Florida nesting beaches, it is useful to combine even and odd years in order to assess annual trends in the total population. A regression of log-transformed nesting in combined two-year cohorts reveals a significant upward nesting trend. Leatherback nest counts in Florida also have been increasing during the past decade. The annual number of leatherback nests at the core set of index beaches ranged from 27 to 357 between 1989 and 2006.

**Georgia/South Carolina/North Carolina:** Only one species of sea turtle, the loggerhead, regularly nests in Georgia, South Carolina, and North Carolina. This northern nesting subpopulation of loggerheads is the second

largest loggerhead nesting aggregation in the western north Atlantic. There is strong statistical evidence to suggest the northern nesting subpopulation has sustained a long-term decline. The green turtle does nest fairly regularly in North Carolina, and occasionally in Georgia and South Carolina, but in small numbers for all three states. In recent years, more regular nesting by the leatherback has been documented in these three states, but again in very small numbers. Occasional solitary Kemp's ridley nesting has occurred in these states.

**Culebra Island, Puerto Rico:** Culebra Island is located to the east of the main island of Puerto Rico and hosts a key U.S. nesting population of leatherbacks. Nest counts have been increasing during past decade.

**Fajardo, Puerto Rico:** The Fajardo area on the main island of Puerto Rico is a key U.S. nesting beach for leatherbacks.

**Humacao**, **Puerto Rico**: The Humacao area on the main island of Puerto Rico is a key U.S. nesting beach for hawksbills. Some leatherback nesting also occurs in this area.

**Mona Island, Puerto Rico:** Three sea turtle species are known to nest on Mona Island, including the hawksbill, green, and leatherback turtles. However, Mona Island is most important for hawksbills. Mona's hawksbill nesting population is the largest under U.S. jurisdiction, and the second largest in the Caribbean, after Barbados.

**Buck Island Reef National Monument, U.S. Virgin Islands:** Buck Island Reef hosts one of the most important nesting areas for hawksbills in the U.S. Caribbean.

**Sandy Point, U.S. Virgin Islands:** Sandy Point hosts one of the largest nesting populations of leatherbacks in the United States. The number of females nesting annually at Sandy Point, as well as the number of nests laid, has significantly increased since 1991.

**French Frigate Shoals, Hawaii:** French Frigate Shoals in the Northwestern Hawaiian Islands is an open atoll consisting of a large, crescent-shaped reef surrounding numerous small, sandy islands. The principal rookery for the Hawaiian green turtle is located on these sand islands at French Frigate Shoals, and it accounts for greater than 90% of all nesting within the Hawaiian Archipelago. The main rookery island at the French Frigate Shoals is East Island where at least 50% of all French Frigate Shoals nesting occurs. There has been a substantial long-term increase in nesting abundance since surveys began in 1973 following cessation of harvesting in the 1970s.

-----

Approximately 20% of the nesting beaches of the southeastern U.S. are public lands, including National Wildlife Refuges (NWR), National or State or County Parks, or military installations. Archie Carr National Wildlife Refuge and Hobe Sound National Wildlife Refuge in Florida were established primarily for the protection of high density nesting beaches for Cc and Cm. The two major hawksbill nesting beaches in the U.S. Caribbean, Buck Island Reef National Monument, U.S. Virgin Islands, and Mona Island, Puerto Rico, are protected as a National Park and Commonwealth Protected Area respectively. The two most important leatherback nesting beaches in the U.S. Caribbean, Sandy Point, U.S. Virgin Islands and Brava and Resaca Beaches, Culebra, Puerto Rico, are protected as a National Wildlife Refuge and Commonwealth Protected Area, respectively, primarily to protect the nesting leatherback populations.

#### **FORAGING SITES**

Foraging sites in the Atlantic and Gulf of Mexico exist in virtually all inshore and nearshore waters, use of these sites vary seasonally and by species. In the northeast U.S., seasonal migrations to warmer waters occur. Some important inshore areas that have been studied include Cape Cod Bay, Long Island Sound, Chesapeake Bay, Indian River Lagoon, Florida Bay, Marquesas Keys, Ten Thousand Islands, Cedar Keys, St. Joe Bay, and Laguna Madre. Nearshore foraging sites are found offshore virtually all the coastal states from Massachusetts to Texas and throughout Puerto Rico and the U.S. Virgin Islands. Important foraging sites for leatherbacks in the Pacific include Monterey Bay, California and, for green turtles, San Diego Bay, California. Foraging sites for green turtles in Hawaii are found throughout the main Hawaiian Islands. Foraging sites further from shore exist in U.S. federal waters (the Exclusive Economic Zone) and include important sites for leatherbacks and loggerheads offshore the northeast United States and Gulf of Mexico coast.

#### **MIGRATORY SITES**

Migratory areas in U.S. waters are widespread throughout the Gulf of Mexico, Atlantic, and Pacific. Important migratory habitat exists along the entire Hawaiian archipelago for breeding green turtles. Migratory habitat for leatherbacks includes areas offshore central and southern California, as well as the Atlantic coast of the U.S. Green turtles make regular breeding migrations from the east coast of Florida along the southeast Florida coast and into, as well as through, the Florida Keys, and offshore Southwest Florida. Loggerheads and green turtles make breeding migrations to and from the Bahamas. Breeding migrations to Cuba and Mexico from the east and west coasts of Florida are also common. The entire Atlantic Coast and Gulf of Mexico coast serve as migratory areas for both adults and juveniles of the various species as they follow prey or migrate in response to changing water temperatures.

#### 2. Information regarding the use derived from sea turtles

There is no legal consumptive use of turtles or turtle products in the U.S. There are a very insignificant but unknown number of nests poached and a low level of poaching of green turtles occurs in Puerto Rico for meat.

	Tymes of use	Cnasia	Products	Ocean	Ori	gin*	Estimated	Information	Aationa
	Types of use	Specie	Products	Basin	L	I	annual quantity	source	Actions

many hatchlings are misdirected and killed by Puerto Rico, artificial lighting. Reports of hatchling disorientation events in Florida describe several hundred nests each year and are likely to involve tens of thousands of hatchlings. However, this number calculated from disorientation reports is likely to be a vast underestimate.  Independent of these reports, Witherington et al. (1996) surveyed hatchling orientation at nests located at 23 representative beaches in six counties around Florida in 1993 and 1994 and found that, by county, approximately 10 to 30% of nests showed evidence of hatchlings disoriented by lighting. From this survey and from measures of hatchling production, the number of hatchlings disoriented by lighting in Florida alone is calculated to be in the range of hundreds of thousands per year.  Vessel Strikes  Cc. Cm. Dc, Email, medium, and large vessels strike turtles in all U.S. waters. Injury and mortality result. # 3.2. Capture (Intentional/incidental)

Threats	Specie(s) Affected	Size of Impact	Geographic Region(s) Affected	Information Source	Actions
Incidental capture in bottom and mid-water trawls	Cc, Lk, Dc, Cm	High		NMFS	Bottom and mid-water trawls pose significant threats to sea turtles in U.S. waters. Regulations have been implemented to require TEDs in shrimp and summer flounder fishery. Research underway on skimmer trawls. Evaluation of TEDs in non-shrimp bottom and mid-water trawls also underway and implentation of TEDs in these fisheries is
Incidental capture in gillnets	Cc, Cm, Ei, Dc, Lk	High	of Mexico, Caribbean	NMFS	under consideration.  Large and midsize gillnets are a significant threat to sea turtles in U.S. waters wherever overlap occurs.  The states of FL, TX, GA, and SC prohibit gillnetting in state waters. Federal time and area closures have been promulgated to regulate large mesh gillnets along the Atlantic coast. Studies are underway to identify other gillnet fisheries and areas that have interactions with sea turtles.
Incidental capture in longlines	Cc, Dc, Lo	High	Atlantic, Gulf of Mexico,	NMFS	Longline fisheries throughout U.S. waters pose

			Pacific		significant threats to sea turtles. Federal regulations have been implemented requiring circle hooks in certain segments of the fishery, handling requirements, and time/area closures. Additional studies are underway to further
					reduce bycatch in longline gear.
Incidental capture in pots and traps	Cc, Dc, Cm	Medium to High	Atlantic, Gulf of Mexico	NMFS	Entanglement in pot and trap fisheries is a significant problem for certain species in certain areas. Research is just beginning on how to reduce these interactions and to quantify these interactions more accurately.
Incidental capture in dredge gear	Сс	Medium to High	Atlantic	NMFS	Fisheries using towed bottom dredges to catch target species are a significant threat to sea turtles. Research is underway to develop modifications to dredge gear to reduce interactions and harm. Regulations are in place to require a modification for scallop dredge gear to prevent turtles from being captured in the water column. Further work is needed to address interaction on the bottom.

#### 5. Exceptions

There are no exceptions provided to Article IV, Paragraph 2(a).

#### **6.** Conservation Efforts

#### 6.1 General description of the sea turtle protection and conservation program

Federal recovery plans, developed under the U.S. Endangered Species Act serve as the official guiding documents for conservation and recovery. Recovery Plans have been issued for all of the sea turtles occurring in the U.S. Extensive efforts have followed from those recovery plans, at the federal, state, and local level. Efforts at the local and state level have been primarily focused on conservation and recovery activities at nesting beaches, although a number of coastal states have become more engaged in

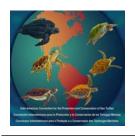

implementing sea turtle conservation actions in the marine and estuarine environment. At the federal level, the U.S. Fish and Wildlife Service's conservation and recovery program is focused on nesting beaches, while the U.S. National Marine Fisheries Service focuses on conservation and recovery in the marine and estuarine environment. A general description of these two respective efforts follows.

In the Southeast United States, major nest protection efforts and beach habitat protection are underway for most of the significant nesting areas, and progress has been made in reducing mortality from human-related impacts on the nesting beach. Many coastal counties and communities in Florida, Georgia, and South Carolina have developed lighting ordinances to reduce the impacts of beachfront lighting on sea turtles. Although compliance with these local ordinances varies widely, adoption and effective enforcement of such ordinances has contributed significantly to sea turtle conservation.

Important U.S. nesting beaches have been and continue to be acquired for long-term protection. The Archie Carr National Wildlife Refuge, located in Brevard and Indian River Counties, Florida, represents the United States' most significant land acquisition effort to protect the loggerhead and green turtles. The acquisition plan for the refuge set a goal for purchase of 9.3 miles of beach within a 20-mile stretch where nesting densities often exceed 1,000 nests per mile. The establishment of the Archie Carr refuge was made possible by a multi-agency land acquisition effort. The U.S. Fish and Wildlife Service has 14 additional refuges in the Southeast where sea turtles regularly nest and are provided protection. Numerous coastal national seashores, military installations, and state parks in the Southeast also provide protection for sea turtles on their lands.

The most longstanding beach management program in the Southeast U.S. has been to reduce the destruction of nests by natural and introduced predators. Most major nesting beaches in the Southeast employ some type of lethal (trapping, hunting) or non-lethal (screen, cage) control of mammalian predators to reduce nest loss. These programs are conducted in an ecologically sound manner, and are primarily aimed at feral animal species and native species, such as raccoons, whose populations have risen exponentially with the extirpation of natural predators and the creation of artificial habitats and coastal development to which they are attracted. In 2002, over 90% of known loggerhead nests in North Carolina and Georgia were protected with a wire or plastic screen or cage. In Florida and South Carolina, screens or cages were employed on 47% and 57% of nests, respectively. Predator removal (trapping, hunting) was used to reduce feral hog, raccoon, and fox depredation on approximately 10% of beaches in North Carolina, South Carolina, and Florida. In Georgia, 42% of nest protection projects used trapping and hunting to reduce feral hog populations. Overall, nest protection activities have substantially reduced sea turtle nest depredations although the magnitude of the reduction has not been quantified.

In Florida, index nesting beaches have been established on 399 kilometers of beach. These beaches have been monitored consistently since 1989 to assess trends in loggerhead, green, and leatherback nesting. In the states of Georgia, South Carolina, North Carolina, and Alabama, standardized nesting surveys are conducted annually to assess loggerhead nesting trends. Additionally, nearly all nesting beaches in the

southeastern U.S. have a nest protection program in place and problems with depredation, light pollution, beach driving, or other threats or conflicts are regularly reported to City, County, State, and Federal agencies for resolution. A large number of coastal communities, counties, and military bases have light management ordinances and/or plans in place and they are enforced to varying degrees.

Leatherback surveys and nest protection activities have been underway on the major nesting beaches in Puerto Rico and U.S. Virgin Islands since at least the mid 1980s. Similarly, surveys and nest protection efforts have been and are conducted at the two major hawksbill nesting beaches in the U.S. Virgin Islands (Buck Island Reef National Monument) and Puerto Rico (Mona Island).

Conservation and recovery activities in the marine environment have focused primarily on the reduction of bycatch in fisheries (including an active gear research program to develop fishing gear and practices to reduce and eliminate sea turtle bycatch), reduction of direct take and minimization of habitat alterations during channel and sand dredging activities, monitoring and evaluation of stranded turtles, implementation of in-water surveys, and research on distribution, movements and migrations.

#### **6.2 Relevant Projects and Activities**

Project/Activities	General objective	Results obtained	Duration	
Troject/Activities	General objective	Results obtained	From	Until
Establish Archie Carr National Wildlife Refuge, Florida.	Acquire and protect 15 km of beach within a 32-km stretch where loggerhead nesting densities often exceed 1,000 nests per mile.	Over 60% of the available beachfront acquisitions for the Refuge have been completed.	1989 to proceed continuing	
Establish Sandy Point National Wildlife Refuge, U.S. Virgin Islands.	Protect approximately 3 km of the highest density leatherback nesting beach in the U.S.	The original acquisition plan approved in 1984 and the expansion plan approved in 1999 have both been completed.	1984-200	0
Conduct long-term index/standardized nesting surveys on loggerhead beaches throughout Florida, Georgia, South Carolina, and North Carolina.	Long term monitoring of nesting population trends.			going
Conduct long-term	Long term monitoring of	Mona Island - 2 years of high quality	Mona Isla	
standardized nesting surveys at the two most important hawksbill	nesting population trends.	stardardized nesting data have been collected.  Buck Island - 15 years of high quality	2003 - on Buck Isla 1990 - on	nd =

nesting beaches in the U.S. (Mona Island, Puerto Rico, and Buck Island Reef National Monument, U.S. Virgin Islands)		standardized nesting data have been collected.	
Carry out intensive nest protection activities throughout the Southeast Region.	Reduce the annual rate of mammalian predation to at or below 10% of nests.	Most major nesting beaches in the Southeast now employ some type of control (trapping, hunting, nest screening/caging) of mammalian predators to reduce nest loss. In 2002, over 90% of known loggerhead nests in North Carolina and Georgia were protected with a wire or plastic screen or cage. In Florida and South Carolina, screens or cages were employed on 47% and 57% of nests, respectively. Predator removal was used to reduce feral hog, raccoon, and fox depredation on approximately 10% of beaches in North Carolina, South Carolina, and Florida. In Georgia, 42% of nest protection projects used trapping and hunting to reduce feral hog populations. Overall, nest protection activities have substantially reduced sea turtle nest depredations.	1980s - ongoing
Remove exotic vegetation and fence hawksbill nesting beaches at Mona Island, Puerto Rico.	Improve the quality of the nesting beach and prevent extensive hog nest depredation.	Control of Australian pines through the removal of seedlings and elimination of larger trees through girdling is continuing, as well as the maintenance and repair of pig and goat exclosure fences.	Late 1980s - present
Require beach renourishment projects on high density nesting beaches to occur outside of main part of nesting season.	Minimize manipulation of nests on high density nesting beaches.	Through the section 7 consultation process of Endangered Species Act, the U.S. Fish and Wildlife Service requires that nourishment projects in six counties on the southeast coast of Florida (Brevard through Broward County) not be conducted during the main part of the nesting season (May 1 through October 31), the period of peak sea turtle egg laying and egg hatching, to reduce the possibility of sea turtle nest burial, crushing of eggs, or nest excavation.	1980s - present

Implement and enforce lighting ordinances and light management plans for coastal counties and municipalities, and military installations in Florida, Georgia, South Carolina, North Carolina, and Alabama.	Minimize hatchling mortality from disorientation and misorientation.	Lighting ordinances have been passed and are being enforced to various degrees in 18 counties and over 50 municipalities in Florida, all the developed islands in Georgia, 2 counties and 7 municipalities in South Carolina, 1 municipality in North Carolina, and 1 municipality in Alabama. Military installations (e.g., Cape Canaveral Air Force Station, Patrick Air Force Base) have light management plans in place.	1987 - present
Fisheries Bycatch Reduction and Fisheries Bycatch Research	Reduce incidental capture in fisheries through gear and/or fishing practice modifications and time/area closures. Develop gear modification to reduce and eliminate bycatch.	Federal and state regulatory actions have been taken to reduce bycatch and mortality in some fisheries and in some areas. Most notable and widespread are the development and requirements to use TEDs in shrimp trawls and summer flounder trawls, prohibition of gillnets in state waters of South Carolina, Georgia, Florida, and Texas, development of and requirements to use circle hooks in pelagic longline fisheries, restrictions on the use of large mesh gillnets in U.S. federal waters of the mid-Atlantic and research on modifications to pound net leaders to reduce and eliminate entanglement and impingement of turtles.	1975 - present
Sea Turtle Stranding and Salvage Network	Document strandings (debilitated or dead) throughout U.S. coastal areas. Characterize injuries and anomalies, facilitate transfer of live strandings to rehabilitation centers, and collect basic life history data.	Centralized database for the Atlantic and Gulf of Mexico, centralized database for Hawaii. Standardized reporting across large geographic areas resulting in extensive database and information on species composition and distribution, size structure, sex, and anomalies. Rapid response to live strandings and efficient transport to rehabilitation facilities.	1980 – present
In-water studies	Monitor trends in abundance, demographic parameters, genetic identity, species composition, health status, foraging site residency	Within U.S. waters approximately 20 inwater sites are regularly monitored and sampled. Efforts are underway to establish an index in-water monitoring program in U.S. waters of the Atlantic and Gulf of Mexico.	Individual studies vary from 5 years duration to greater than 20 years duration.

### 7. International Cooperation

#### **Barbados**

Funding support to University of West Indies to survey and protect hawksbill nests.

#### **Brazil**

Funding support to Fundacao Pro-Tamar survey and protect hawksbill nests in Northern Bahia

#### Costa Rica

Funding support to Costa Rica Wildlife Conservation Society for leatherback nesting surveys and protection at Playa Langosta.

#### Mexico

Funding support to Pronatura de Peninsula de Yucatan for hawksbill nesting surveys and protection covering about 75 km and 15% of the hawksbill nesting in the Yucatan Peninsula; to Gladys Porter Zoo for Kemp's ridley nest protection in State of Tamaulipas in partnership with Mexico Secretary of Environment (SEMARNAT); to the University of Michoacan for nest survey and protection of black turtles at the major nesting beach of Colola, State of Michoacan; to Kutzari for leatherback nest surveys and protection on the primary and some secondary nesting beaches of MX Pacific coast in collaboration with SEMARNAT.

#### Nicaragua

Funding support for the Wildlife Conservation Society to conduct hawksbill nesting surveys and protection in the Pearl Keys, the most important remaining hawksbill nesting area in Nicaragua.

#### **Panama**

Funding support for hawksbill and leatherback nesting surveys and protection in collaboration with Caribbean Conservation Corporation, Nogbe Indian communities, and Panamanian National Authority. Effort to restore the historic nesting beach at Chiriqui Beach, Bocas del Toro Province, which was once the largest in the Caribbean.

#### **Multiple Countries Throughout the Convention Area**

Active bycatch reduction technology transfer program for TEDs in trawl fisheries and fishing practices and circle hooks in pelagic longline fisheries. Funding support for testing of longline gear modification in various fleets throughout the Convention Area. Funding support for testing of gillnet gear modifications to reduce leatherback bycatch in Trinidad.

#### 8. National Directory
